Training Assessment Tracker

Initial Project Concept & Requirements

---

1. Project Overview

Training Assessment Tracker is a training and employee development sub-application of **Cerebru**.

The application will provide a centralised system for managing employee assessments, AI-assisted scoring, development planning, training activities, weekly progress, and ongoing skills development.

The application should be designed as a **white-label solution**, allowing individual clients or organisations to use the system with their own branding while sharing the same underlying application.

The primary development cycle is:

> **Assess → Analyse → Plan → Train → Measure → Adjust**

AI will assist throughout this process, but the **Training Coordinator remains responsible for reviewing and approving AI-generated results and recommendations**.

---

2. Problem

Training and employee development can become difficult to manage when assessments, development plans, training activities and progress are handled manually.

The application should provide a structured way to:

- Assess a member's current skills.
- Identify strengths and development gaps.
- Use AI to analyse assessment results.
- Generate realistic development plans.
- Allocate achievable training time within normal working hours.
- Track weekly progress.
- Measure development over time.
- Adjust training plans based on previous results.

- Provide members with access to training-related AI assistance.
- Give Training Coordinators visibility and control over the entire development process.

---

3. Who the Application Helps

Admin

The Admin manages the overall system.

Responsibilities include:

- Manage users.
- Add members.
- Manage Training Coordinators.
- Manage clients.
- Manage system settings.
- Manage branding.
- Manage permissions.

Training Coordinator

The Training Coordinator manages the training and development process.

Responsibilities include:

- Add members.
- Import or synchronise members from Cerebru.
- Assign assessments.
- Review assessment submissions.
- Review AI-generated assessment scores.
- Understand how AI arrived at its score.
- Approve or modify assessment results.
- Generate development plans.
- Review and approve development plans.
- Monitor member progress.
- Review weekly results.
- Adjust training plans.
- Receive member notes.
- Monitor development growth.

Member

The Member participates in the training and development process.

Responsibilities include:

- Complete assessments.
- Upload assessment results.
- Provide explanations or additional context.
- Review assessment results.
- Review development plans.
- Complete assigned training activities.
- Submit weekly progress.
- Submit notes directly to the Training Coordinator.
- Ask questions through the AI training chatbot.

---

4. User Roles

The initial roles are:

1. **Admin**
2. **Training Coordinator**
3. **Member**

The architecture should allow additional roles to be introduced in the future if required.

---

5. Client and White-Label Structure

The application must support multiple clients or organisations.

An individual member can belong to a specific client.

Example:

```
Cerebru
│
├── Client A
│   ├── Member 1
│   ├── Member 2
│   └── Member 3
│
├── Client B
│   ├── Member 4
```

```
│   └── Member 5
│
└── Client C
    └── Member 6
```

Each client should be able to have its own branding.

Potential branding options include:

- Client logo.
- Brand colours.
- Client name.
- Application title.
- Custom terminology where appropriate.
- Training programme configuration.

The application should use a shared underlying platform while allowing the user interface and relevant content to be branded per client.

---

6. Cerebru Integration

Training Assessment Tracker should be developed as a **sub-application of Cerebru**.

The architecture should investigate and support integration with Cerebru for:

- Authentication.
- Users.
- Members.
- Clients.
- Teams.
- Roles and permissions.
- Client relationships.
- Relevant member data.

Member Synchronisation

The Training Coordinator should have an option to:

> **Import Members from Cerebru**

and/or:

> **Sync Members with Cerebru**

The purpose is to avoid unnecessary duplicate data entry.

The final synchronisation behaviour should be defined after reviewing the Cerebru API and existing data structure.

---

7. Member Management

The system should allow the Admin and/or Training Coordinator, depending on permissions, to:

- Add a member.
- Edit member information.
- Assign a member to a client.
- Assign a member to a team.
- Import a member from Cerebru.
- Synchronise member information.
- View assessment history.
- View development plans.
- View weekly progress.
- View development growth.

The system should maintain a clear relationship between:

Client → Team → Member → Assessments → Development Plan → Progress

---

8. Assessment Management

The Training Coordinator should be able to create and assign assessments.

The system should support:

- Written assessments.
- Written responses.
- Assessment result uploads.
- Supporting documents.
- Member explanations.
- Assessment history.
- Assessment status.
- AI analysis.

The member should be able to upload their own assessment results rather than requiring the Training Coordinator to perform every submission manually.

9. Assessment Workflow

The assessment workflow should follow this process:

Training Coordinator
↓
Assign Assessment
↓
Member Receives Assessment
↓
Member Completes Assessment
↓
Member Uploads Results
↓
Member Provides Explanation / Context
↓
AI Analyses Submission
↓
AI Calculates Score
↓
AI Explains Scoring
↓
Training Coordinator Reviews
↓
Training Coordinator Approves / Modifies
↓
Final Assessment Result

---

10. AI-Assisted Assessment Scoring

AI should be used to analyse submitted assessment information and provide an initial score.

The AI should provide:

- Overall score.
- Individual category scores.
- Scoring breakdown.
- Explanation of the score.
- Strengths.
- Weaknesses.

- Development gaps.
- Recommended focus areas.

Example:

Overall Score: 74%

Technical Knowledge: 82%
Problem Solving: 71%
Communication: 68%
Practical Application: 75%

The system must also provide an explanation of how the AI arrived at the result.

For example:

Scoring Explanation

Technical Knowledge:
The member demonstrated strong understanding across most technical questions.

Problem Solving:
The member demonstrated an appropriate approach but requires additional development when handling complex scenarios.

Communication:
The responses demonstrate understanding but could be more structured and concise.

The purpose is to make the AI's assessment understandable and reviewable.

---

11. AI Assessment Approval

AI-generated assessment results must enter a review state.

Workflow:

AI Processing
↓
AI Result Generated
↓
Awaiting Coordinator Review

↓
Training Coordinator Reviews
↓
Approve / Modify / Reject
↓
Final Assessment Result

The Training Coordinator should receive a notification when an AI-generated assessment is ready for review.

The Training Coordinator should be able to:

- Review the AI score.
- Review the scoring explanation.
- Review the submitted assessment.
- Modify the result where appropriate.
- Approve the final result.

The AI should not automatically become the final authority for assessment results.

---

12. AI-Generated Development Plan

Once an assessment has been processed and approved, the system should offer the option:

Would you like to create a development plan based on this assessment?

If approved, AI should analyse the assessment and generate a proposed development plan.

The AI should identify:

- Current strengths.
- Skill gaps.
- Priority areas.
- Recommended training.
- Recommended activities.
- Expected outcomes.
- Suggested time allocation.
- Suggested milestones.

---

13. 30-Day Upskill Plan

The application should support the creation of a proposed **30-day upskill plan**.

The AI should consider the member's normal working responsibilities when creating the plan.

The plan should contain achievable training allocations.

For example:

- Training hours per day.
- Training hours per week.
- Practical exercises.
- Reading/research.
- Mentoring.
- Project-based learning.
- Assessment activities.
- Review activities.

The system should avoid generating unrealistic schedules.

The Training Coordinator should be able to modify:

- Training hours.
- Activities.
- Priorities.
- Deadlines.
- Milestones.
- Training resources.

The system should clearly distinguish between:

Normal Workload + Training/Development Time

---

14. Development Plan Approval

AI-generated development plans should be reviewed before becoming an approved plan.

Workflow:

Assessment Approved
↓
Generate Development Plan
↓
AI Creates Proposed 30-Day Plan
↓
Training Coordinator Reviews

↓
Modify if Required
↓
Approve Plan
↓
Member Receives Development Plan

---

15. Weekly Progress

Members should submit weekly progress against their development plan.

Weekly progress may include:

- Completed activities.
- Incomplete activities.
- Time spent.
- Results achieved.
- Challenges encountered.
- Member comments.
- Supporting documents.
- Self-assessment.

The system should compare current progress against previous weeks.

---

16. AI Weekly Progress Analysis

AI should analyse weekly results and identify:

- Improvement.
- Areas where progress has stalled.
- Missed targets.
- Difficulties.
- Areas requiring additional focus.
- Recommended changes to the following week's plan.

Example:

Previous Week:
The member completed 80% of the planned activities.

Observation:

Practical application remains weaker than theoretical knowledge.

Recommendation:
Increase practical exercises during the following week.

The Training Coordinator should review and approve significant changes to the development plan.

---

17. Development Growth Graph

The application should include a visual development growth graph.

The graph should allow users to see development over time.

Potential data points include:

- Initial assessment.
- Week 1.
- Week 2.
- Week 3.
- Week 4.
- Follow-up assessment.

Additional reporting could include:

- Overall development score.
- Skill-by-skill development.
- Assessment history.
- Training completion.
- Weekly progress.

The purpose is to provide a clear visual representation of the member's development.

---

18. Member Notes

Members should have an option to send notes directly to the Training Coordinator.

Examples:

- Training difficulties.

- Questions.
- Feedback.
- Additional assessment context.
- Workload issues.
- Requests for assistance.
- Training resource requests.

The Training Coordinator should receive a notification when a member submits a note.

---

19. AI Training Chatbot

The application should include a simple AI chatbox.

Members can use the chatbot to ask questions about the training programme.

Examples:

> What should I focus on this week?
>
> Explain this training topic.
>
> Why do I need to improve this skill?
>
> What activities can help me improve?
>
> What is my current development goal?
>
> Explain my development plan.

Where appropriate, the chatbot should use the member's approved training programme and development plan as context.

---

20. Written Assessment Support

The application must support written assessments.

Members should be able to:

- Answer written questions.
- Upload assessment documents.
- Upload supporting results.
- Add explanations.

- Submit the assessment.

AI should be able to analyse the written material and provide:

- Score.
- Score breakdown.
- Scoring explanation.
- Strengths.
- Areas for improvement.
- Recommended development areas.

---

21. Email and SMTP

The application should use SMTP to send system notifications and reminders.

Training Coordinator Notifications

Potential notifications:

- New assessment submitted.
- AI assessment completed.
- Assessment awaiting approval.
- Member submitted a note.
- Development plan generated.
- Development plan awaiting approval.
- Weekly progress submitted.
- Member requires attention.

Member Notifications

Potential notifications:

- Assessment assigned.
- Assessment reminder.
- Assessment result approved.
- Development plan available.
- Training reminder.
- Weekly progress reminder.
- Coordinator feedback.

---

22. AI Integration

The application should integrate with a GPT/AI service.

Initial AI functionality should include:

1. Assessment scoring.
2. Scoring explanation.
3. Skill-gap analysis.
4. Development-plan generation.
5. 30-day upskill planning.
6. Weekly progress analysis.
7. Training-plan adjustment recommendations.
8. Training recommendations.
9. Training programme chatbot.

AI output should be transparent and explainable wherever the AI is making an assessment or recommendation.

---

23. Dashboard

Admin Dashboard

Potential information:

- Total clients.
- Total members.
- Total Training Coordinators.
- Active training programmes.
- Assessments completed.
- Assessments awaiting approval.
- Active development plans.
- Overall training activity.

Training Coordinator Dashboard

Potential information:

- Members requiring attention.
- Pending assessments.
- AI assessments awaiting approval.
- Development plans awaiting approval.

- Weekly progress requiring review.
- Members falling behind.
- Development growth.
- Training activity.

Member Dashboard

Potential information:

- Current assessment score.
- Development goals.
- Current development plan.
- Weekly activities.
- Progress.
- Upcoming activities.
- Training reminders.
- AI chatbot.

---

24. Client Branding

The system should support client-specific branding.

Each client should potentially have:

- Logo.
- Brand colours.
- Organisation name.
- Application title.
- Custom training programme settings.

The application should maintain the same core functionality while allowing the client-facing experience to reflect the client's branding.

---

25. Application Architecture

Training Assessment Tracker should be treated as a **Cerebru sub-application** from the beginning of development.

The architecture should consider:

- Shared authentication.
- Shared users.
- Member synchronisation.
- Client relationships.
- Permissions.
- API integration.
- Navigation.
- Notifications.
- Branding.
- Data isolation.
- Security.
- Audit trails.

The final technical architecture should be determined after reviewing the existing Cerebru architecture and technical requirements.

---

26. Proposed Development Workflow

The project should follow a structured AI-assisted development workflow.

Meeting Notes

Iteration

---

27. Initial Concept

The first step is to create a clear project concept covering:

- Problem.
- Users.
- Roles.
- Requirements.
- User flows.
- Business rules.
- AI requirements.
- Integration requirements.
- Branding requirements.
- Notification requirements.

The concept should be reviewed before technical implementation begins.

---

28. Master Project Prompt

A comprehensive master prompt should then be created for the project.

The prompt should describe:

- Business objective.
- Application purpose.
- User roles.
- User permissions.
- Client structure.
- Member management.
- Assessment workflow.
- AI scoring.
- AI explanation.
- Coordinator approval.
- Development plans.
- 30-day upskill plans.
- Weekly progress.
- Development growth.
- AI plan adjustments.

- AI chatbot.
- SMTP.
- Cerebru integration.
- White-label branding.
- Security.
- Database requirements.
- API requirements.
- Testing requirements.
- Repository requirements.
- Deployment requirements.

The goal is to provide enough context for AI development tools to understand the complete application rather than generating disconnected features.

---

29. Archify

The initial project concept and master plan should be provided to **Archify** to generate the application architecture and structure.

The Archify output should be reviewed before implementation.

Review areas should include:

- Application architecture.
- Frontend structure.
- Backend structure.
- Database structure.
- API structure.
- Authentication.
- Permissions.
- Cerebru integration.
- Client structure.
- Member structure.
- Assessment module.
- AI module.
- Development-plan module.
- Progress module.
- Notification system.
- Branding system.
- Security.
- Testing.

---

30. Repository and Codex CLI

Once the Archify architecture has been reviewed, the resulting structure should be used to establish the project repository.

The repository should become the source code base for the application.

Codex should then work against the repository through the **CLI**.

The preferred workflow is:

Archify Architecture
↓
Project Repository
↓
Codex CLI
↓
Build Structure
↓
Implement Features
↓
Run Tests
↓
Fix Issues
↓
Produce Working Application

The implementation should be driven primarily through the CLI rather than manually performing each development operation through the Codex interface.

---

31. Development Approval Strategy

The development environment should minimise unnecessary approval requests for routine operations.

Standard and predictable development operations may be automatically approved within a controlled development environment.

Examples:

- Create files.
- Modify project files.
- Run tests.

- Run build commands.
- Install approved dependencies.
- Run local development commands.
- Run development database migrations.

High-impact operations should remain controlled.

Examples:

- Production deployment.
- Destructive production database operations.
- Credential access.
- Secret management.
- Infrastructure changes.
- Destructive file operations.

The objective is to avoid excessive approval prompts while maintaining appropriate controls around high-risk actions.

---

32. Initial MVP

The first version should focus on the complete core workflow.

Users

- Admin.
- Training Coordinator.
- Member.

Member Management

- Add member.
- Assign member to client.
- Import from Cerebru.
- Synchronise with Cerebru.

Assessments

- Create assessment.
- Assign assessment.
- Member submission.
- Written responses.

- File upload.

AI

- AI assessment scoring.
- Score explanation.
- Skill-gap analysis.

Approval

- Training Coordinator review.
- Approve.
- Modify.
- Reject.

Development Plans

- AI-generated 30-day plan.
- Coordinator review.
- Coordinator approval.
- Member access.

Progress

- Weekly progress.
- Development growth graph.
- AI progress analysis.
- Plan adjustment recommendations.

Communication

- Member notes.
- SMTP notifications.
- Training reminders.

AI Chat

- Basic training-program chatbot.

Branding

- Client-specific branding.

33. Demo Presentation Structure

The demonstration should tell a complete story rather than simply showing individual screens.

1. Start With the Problem

Explain the difficulty of managing employee assessments, training and development manually.

2. Explain Who It Helps

Introduce:

- Admin.
- Training Coordinator.
- Member.
- Client.

3. Explain the Solution

Explain how Training Assessment Tracker centralises:

- Assessment.
- AI analysis.
- Development planning.
- Training.
- Progress tracking.

4. Demonstrate the User Flow

Use one realistic member throughout the demonstration.

Add Member
↓
Assign Client
↓
Assign Assessment
↓
Member Completes Assessment
↓
AI Scores Assessment
↓

AI Explains Score
↓
Coordinator Reviews
↓
Coordinator Approves
↓
AI Creates 30-Day Plan
↓
Coordinator Approves Plan
↓
Member Performs Training
↓
Member Submits Weekly Progress
↓
AI Analyses Progress
↓
Plan Is Adjusted

5. Demonstrate the Dashboard

Show:

- Assessment score.
- Development growth.
- Current training.
- Weekly progress.
- Areas requiring attention.

6. Demonstrate AI

Show:

- Assessment input.
- AI analysis.
- Score.
- Score breakdown.
- Scoring explanation.
- Development recommendations.

Then demonstrate the Training Coordinator's approval process.

7. Demonstrate Weekly Progress

Show how the system uses the previous week's results to recommend changes to the next week's training plan.

8. Demonstrate Branding

Show how the application can be presented as a branded solution for a specific client.

9. Closing

Finish with the core development cycle:

> **Assess → Analyse → Plan → Train → Measure → Adjust**

---

34. Demo Expectations

The demo should:

- Start with the problem.
- Explain who the application helps.
- Explain the proposed solution.
- Demonstrate the complete user flow.
- Use a realistic example.
- Clearly distinguish completed functionality from planned functionality.
- Demonstrate AI functionality.
- Demonstrate Coordinator approval.
- Demonstrate weekly progress.
- Demonstrate the development growth graph.
- Demonstrate client branding.
- Explain the expected future development.

The demo should focus on the **end-to-end workflow**, not just individual features.

---

35. Open Questions and Requirements to Confirm

The following items need to be clarified before final architecture and development:

1. What is the existing Cerebru technical architecture?

2. Does Cerebru provide an API?
3. What Cerebru data needs to be synchronised?
4. Should Cerebru remain the source of truth for member information?
5. Should Training Assessment Tracker share Cerebru authentication?
6. What assessment formats are required?
7. What scoring methodology should be used?
8. What scoring rubric should AI follow?
9. Who defines and maintains the scoring criteria?
10. What AI provider/model will be used?
11. What information can be sent to the AI service?
12. How should AI scoring disagreements be handled?
13. Should the Training Coordinator be able to manually override AI scores?
14. What information can members see?
15. What information can clients see?
16. What training time allocation is considered realistic?
17. What constitutes successful development?
18. What SMTP provider will be used?
19. What client branding options are required?
20. What functionality belongs in the MVP?
21. What functionality should be deferred to Phase 2?
22. What audit trail is required for AI-generated results?
23. What security and privacy requirements apply to assessment data?
24. What repository and deployment environment will be used?
25. How should Training Assessment Tracker be integrated into the Cerebru navigation?

---

36. Core Product Principle

Training Assessment Tracker should not simply function as an assessment tracker.

It should provide a **continuous employee development system**.

The central process is:

Assess → Understand → Plan → Train → Measure → Adjust

AI assists with analysis and recommendations.

The Training Coordinator provides human oversight and approval.

The Member participates in and owns their development activities.

Cerebru provides the broader platform in which Training Assessment Tracker operates.

---

37. Proposed Next Step

The immediate next step is to create the **initial project concept and master development prompt**.

The proposed workflow is:

1. Finalise the project concept.
2. Create the master AI development prompt.
3. Generate the detailed technical/project plan.
4. Upload the plan to Archify.
5. Generate the application architecture.
6. Review the Archify output.
7. Create/link the repository.
8. Use Codex CLI to build the application structure.
9. Implement the MVP.
10. Test the complete user flow.
11. Prepare the demonstration.
12. Gather feedback.
13. Iterate and expand the application.

The first milestone should be a **clear Archify-ready specification**, not the immediate implementation of the application.
